

## Using JSON | Lesson 2

# Practice 1: JSON Travel Itinerary

## Instructions

Create a JSON object to represent a complex travel itinerary using nested objects, arrays, and hierarchical relationships.

### Scenario:

You are working on a travel application that needs to store information about a multi-destination trip. Your task is to create a JSON object to represent a travel itinerary. The itinerary should include the following details:

- **Trip Name:** A name for the trip.
- **Traveler:**
  - **name:** The traveler's full name.
  - **contact:** Includes **email** and **phone**.
- **Destinations:** Each destination should include:
  - **location:** The name of the destination (e.g., "Paris").
  - **arrivalDate:** The date of arrival in the format YYYY-MM-DD.
  - **departureDate:** The date of departure in the format YYYY-MM-DD.
  - **activities:** Each activity should include:
    - **title:** The name of the activity.
    - **time:** The scheduled time (e.g., "10:00 AM").

## Tasks

- Requirements Create a JSON object that meets the specification above and includes:
  - At least two destinations.
  - At least two activities for each destination.
- Ensure your JSON object is well-structured, logically grouped, and formatted properly.

## Setup

For this activity, you will create your own repository to store your code:

1. Create a new repository.

2. Name it: practice-JSON-travel-itinerary-[Your First Name]-[Your Last Initial]
3. Make sure the repository is public.
4. Clone the repository to your local machine.
5. Start working on the code.
6. When you are finished, commit your changes and push them to your repository.

## Submission

Submit the url for your GitHub repo in the field below.
